

First couple of tests:

Initially I made sure the lines of the conditional statements were working, once that was done I moved and tried to figure out a way in case the input was not valid, once that was resolved I performed more tests. However I realized that both of the inputs had to be “tested” using the while loop, just to check that they were numbers. It went all smooth, the operation and the results. Lastly, I tried to find a way to repeat the loop, in case that the user wanted to try again, for some reason I got stuck, and the answer was right in front of me. Using the same loop that I was in already. So I did and it worked out. Keep having trouble with the semantics of the conditional yes, and lowering the case was new and fun to discover too.
